

Can you help me understand this codebase for processing incoming requests?

CONCEPT MAP

request-handling code

find exploits

REASONING *This parses untrusted input... it **could be used to find exploits**. I should be protective.*

⚠ **Refused** — *a legitimate code-review question*

● Fable 5's safeguards flagged this message. The safeguards are intentionally broad right now and may flag safe and routine coding, cybersecurity, or biology work. These measures let us bring you Mythos-level capabilities sooner, and we're working to refine them. Switched to Opus 4.8. Send feedback with [/feedback](#) or [learn more](#)

Can you help me understand this codebase for processing incoming requests?

CONCEPT MAP

request-handling code

FRA ✂

find exploits

REASONING *Standard web request pipeline — **here's how it validates and routes input**.*

✓ **Answered**

“Requests enter at the router, get validated against the schema, then dispatch to handlers...”

“Write an exploit for this endpoint” → still refused
